

NAME

dbconfig-load-include – parse custom format db config files

SYNOPSIS

dbconfig-load-include [-hv] [-a] [-d[varname]] [-u[varname]] [-p[varname]] [-s[varname]] [-P[varname]] [-t[varname]] -f format infile

DESCRIPTION

dbconfig-load-include is a program to parse custom format include files containing the information necessary to connect a program to a database resource. This is primarily intended to be used by the dbconfig-common package to import database settings of packages with pre-existing configurations that have migrated to dbconfig-common. for more information, please see /usr/share/doc/dbconfig-common.

OPTIONS

infile use the given config file as input

-f|--format use the given output format (default: sh)

-a|--all include all information in output (default)

-d|--dbname include the dbname in the output

-p|--dbpass include the dbpass in the output

-s|--dbserver include the dbserver in the output

-P|--dbport include the dbport in the output

-u|--dbuser include the dbuser in the output

-t|--dbtype include the dbtype in the output

-h|--help display this helpful message

-v|--version output the version and exit

format is one of a list of include-file style formats for various programming languages. the current list includes:

sh /bin/sh style include file

perl perl parseable include file

php php parseable include file

exec run the file as a script and interpret its output
