

**NAME**

`__malloc_hook`, `__malloc_initialize_hook`, `__memalign_hook`, `__free_hook`, `__realloc_hook`, `__after_morecore_hook` – malloc debugging variables

**SYNOPSIS**

```
#include <malloc.h>

void *(*__malloc_hook)(size_t size, const void *caller);
void *(*__realloc_hook)(void *ptr, size_t size, const void *caller);
void *(*__memalign_hook)(size_t alignment, size_t size,
                        const void *caller);
void (*__free_hook)(void *ptr, const void *caller);
void (*__malloc_initialize_hook)(void);
void (*__after_morecore_hook)(void);
```

**DESCRIPTION**

The GNU C library lets you modify the behavior of [malloc\(3\)](#), [realloc\(3\)](#), and [free\(3\)](#) by specifying appropriate hook functions. You can use these hooks to help you debug programs that use dynamic memory allocation, for example.

The variable `__malloc_initialize_hook` points at a function that is called once when the malloc implementation is initialized. This is a weak variable, so it can be overridden in the application with a definition like the following:

```
void (*__malloc_initialize_hook) (void) = my_init_hook;
```

Now the function `my_init_hook()` can do the initialization of all hooks.

The four functions pointed to by `__malloc_hook`, `__realloc_hook`, `__memalign_hook`, `__free_hook` have a prototype like the functions [malloc\(3\)](#), [realloc\(3\)](#), [memalign\(3\)](#), [free\(3\)](#), respectively, except that they have a final argument `caller` that gives the address of the caller of [malloc\(3\)](#), etc.

The variable `__after_morecore_hook` points at a function that is called each time after [sbrk\(2\)](#) was asked for more memory.

**CONFORMING TO**

These functions are GNU extensions.

**NOTES**

The use of these hook functions is not safe in multithreaded programs, and they are now deprecated. From glibc 2.24 onwards, the `__malloc_initialize_hook` variable has been removed from the API. Programmers should instead preempt calls to the relevant functions by defining and exporting functions such as "malloc" and "free".

**EXAMPLE**

Here is a short example of how to use these variables.

```
#include <stdio.h>
#include <malloc.h>

/* Prototypes for our hooks. */
static void my_init_hook(void);
static void *my_malloc_hook(size_t, const void *);

/* Variables to save original hooks. */
static void *(*old_malloc_hook)(size_t, const void *);

/* Override initializing hook from the C library. */
void (*__malloc_initialize_hook) (void) = my_init_hook;

static void
my_init_hook(void)
```

```
{  
old_malloc_hook = __malloc_hook;  
__malloc_hook = my_malloc_hook;  
}  
  
static void *  
my_malloc_hook(size_t size, const void *caller)  
{  
void *result;  
  
/* Restore all old hooks */  
__malloc_hook = old_malloc_hook;  
  
/* Call recursively */  
result = malloc(size);  
  
/* Save underlying hooks */  
old_malloc_hook = __malloc_hook;  
  
/* printf() might call malloc(), so protect it too. */  
printf("malloc(%u) called from %p returns %p\n",  
(unsigned int) size, caller, result);  
  
/* Restore our own hooks */  
__malloc_hook = my_malloc_hook;  
  
return result;  
}
```
