

NAME

`fpclassify`, `isfinite`, `isnormal`, `isnan`, `isinf` – floating-point classification macros

SYNOPSIS

```
#include <math.h>
int fpclassify(x);
int isfinite(x);
int isnormal(x);
int isnan(x);
int isinf(x);
```

Link with `-lm`.

Feature Test Macro Requirements for glibc (see [feature_test_macros\(7\)](#)):

```
fpclassify(), isfinite(), isnormal():
_ISOC99_SOURCE || _POSIX_C_SOURCE >= 200112L
isnan():
_ISOC99_SOURCE || _POSIX_C_SOURCE >= 200112L || _XOPEN_SOURCE /* Since glibc
2.19: */ _DEFAULT_SOURCE /* Glibc versions <= 2.19: */ _BSD_SOURCE || _SVID_SOURCE
isinf():
_ISOC99_SOURCE || _POSIX_C_SOURCE >= 200112L /* Since glibc 2.19: */ _DE-
FAULT_SOURCE /* Glibc versions <= 2.19: */ _BSD_SOURCE || _SVID_SOURCE
```

DESCRIPTION

Floating point numbers can have special values, such as infinite or NaN. With the macro `fpclassify(x)` you can find out what type *x* is. The macro takes any floating-point expression as argument. The result is one of the following values:

FP_NAN *x* is "Not a Number".

FP_INFINITE *x* is either positive infinity or negative infinity.

FP_ZERO *x* is zero.

FP_SUBNORMAL

x is too small to be represented in normalized format.

FP_NORMAL if nothing of the above is correct then it must be a normal floating-point number.

The other macros provide a short answer to some standard questions.

isfinite(x) returns a nonzero value if
 `(fpclassify(x) != FP_NAN && fpclassify(x) != FP_INFINITE)`

isnormal(x) returns a nonzero value if `(fpclassify(x) == FP_NORMAL)`

isnan(x) returns a nonzero value if `(fpclassify(x) == FP_NAN)`

isinf(x) returns 1 if *x* is positive infinity, and -1 if *x* is negative infinity.

ATTRIBUTES

For an explanation of the terms used in this section, see [attributes\(7\)](#).

Interface	Attribute	Value
<code>fpclassify()</code> , <code>isfinite()</code> , <code>isnormal()</code> , <code>isnan()</code> , <code>isinf()</code>	Thread safety	MT-Safe

CONFORMING TO

POSIX.1-2001, POSIX.1-2008, C99.

For `isinf()`, the standards merely say that the return value is nonzero if and only if the argument has an infinite value.

NOTES

In glibc 2.01 and earlier, **isinf()** returns a nonzero value (actually: 1) if x is positive infinity or negative infinity. (This is all that C99 requires.)
